                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     surface of a replicable display package, synthesising oligopeptides derived from the target protein on a solid phase, and testing for binding between the peptide and oligopeptides. The method is used to screen large peptide libraries, especially to detect antibodies, or their fragments, that bind to cell markers or that can differentiate between different
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Synthetic oligopeptides W60537-61 are derived from the extracellular domain of CD64. They were synthesised on 25 polyethylene rods as adjacent, non-overlapping sets. Peptide specific phages were isolated by affinity binding to the CD64-covered rods. The specification describes a method for the identification of a peptide able to bind specifically to a target protein. The method comprises displaying the peptide on the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         by mutation in (anti)oncogenes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            selected peptides can be isolated and used for recombinant production of antibodies. Selected antibodies are used, e.g. for immunohistochemical or immunofluorescent analysis, and also to detect cell transformation caused

Three-dimensional structures and models of Fc receptors, useful in computer-assisted drug design $% \left(1\right) =\left\{ 1\right\}$

This amino acid sequence was predicted from the cDNA sequence of CDNA clone p98/X2. It differs from the sequence predicted from clone p185 (see Q21178) at position 25, p135 encodes a Ser residu while clone p98/X2 predicts a Thr residue. At position 58, p90

Ser residue 58, p90

Example 10;

Page 94a; 160pp; English.

New CD53 cell surface antigen and DNA encoding it - for immuno-therapy and diagnosis of haematopoietic neoplasms, etc.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   that inhibit the activity of Fc-gammaR or Fc-epsilonR can be used to reduce IgG- or IgE-mediated tissue damage, e.g. IgG- or IgE-mediated hypersensitivity; recruitment of inflammatory cells or release of inflammatory modulators. The therapeutic compositions can also be used to treat disease in animals. The knowledge of the 3-D structure of Fc-gamma RIA and models of other FCR provides a means for designing and producing compounds that regulate immune function and inflammation in an animal, including humans (i.e. structure based drug design). For example, chemical compounds can be designed to block binding of immunoglobulin to

                 The amino acid sequence (R91439) of human FCRI was detd. from a cDNA library using an immunoselection cloning method. FCRI is a high affinity receptor for the Fc portion of IgG, normally located on cell surfaces of macrophages. 2 Other cDNA clones, pl35 (T14717) and p90 (T14719), coded for a variants of the FCRI sequence; the C-terminal sequence
                                                                                                                                                                                           Cloning of cDNA encoding cell surface antigen of diagnostic and therapeutic proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                             01-DEC-1992;

immune-complex disease, amyloidosis, parasitic diseases or multiple sclerosis. FcRI is a high affinity receptor for the Fc portion of IgG, normally located on the cell surfaces of macrophages. The ability to interfere with such bonding, or to cause it to occur on surfaces other than macrophages, is useful in therapy. A fusion protein of FcRI and a receptor ligand will be helpful to increase
                                   surfaces other than macrophages, protein of FCRI and a receptor 1 the potencies of antibodies in t
                                                                                                                                                                                          (panning on) an antibody-coated substrate such as a culture dish. CSA nucleic acids isolated by the method of the invention, and the proteins they encode, are useful for immunodiagnostic and immunotherapeutic applications, including the diagnosis and treatment of immune-mediated infections, diseases, and disorders in treatment of immune-mediated infections, diseases, and disorders in the contract of immune-mediated infections.
                                                                                                                                                                                                                                                                                          The present sequence is that of a human macrophage specific FCRI, as deduced from cDNA clone pl35 (see A50631), which was isolated from a cDNA library expressed in COS cells using a novel method of the invention designed to isolate CSA nucleic acids. The method is based upon transient expression of a CSA in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        25-FEB-1988;

It differs from the sequence predicted from clones p98/X2 and p90 (see Q21179 and Q21180, respectively) at position 25; p135 encodes a Ser residue and the other two clones predict a Thr residue. At position 58, p135 predicts Leu and p90 predicts Val. Sequences predicted from all 3 clones show the typical features of a type I integral membrane protein and include a short hydrophobic signal sequence, a single 21-residue hydrophobic membrane-spanning domain, and a short, highly charged cytoplasmic domain. The extracellular portion contains six protein and allowed the contains and a short in the charged cytoplasmic domain. The extracellular portion contains six protein and a short in the charged cytoplasmic domain.
                                                                                                                                                                                                                                                                                                                                                                                                    potential N-linked glycosylation sites and six Cys residues distributed among three C2 set Ig-related domains. A fusion protein of FCRI and a receptor ligand will be helpful to increase the potency of antibodies in therapy.

It differs from the sequence predicted from clone p135 (see Q21178) at position 25; p135 encodes a Ser residue and clone p90 predicts a Thr residue. At position 58, p90 predicts val while clones p135 and p98/X2 (see Q21179) both predict Leu. Sequences predicted from all 3 clones show the typical features of a type I integral membrane protein and include a short hydrophobic signal sequence, a single 21-residue hydrophobic membrane-spanning domain, and a short, highly charged cytoplasmic domain. The extracellular portion contains six potential N-linked glycosylation sites and six Cys residues distributed among three C2 set Ig-related domains. A fusion protein of FCRI and a receptor ligand will be believed the protein of FCRI and a receptor ligand will be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This amino acid sequence was predicted from the cDNA sequence of cDNA clone p90.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The amino acid sequence (R91438) of human FCRI was detd. from a CDNA clone, p135 (T14717), obtd. from a CDNA library using an immunoselection cloning method. FCRI is a high affinity receptor for the FC portion of IgG, normally located on cell surfaces of macrophages. Another isolated cDNA clone, p90 (T14719), coded for a variant (W00859) of the FCRI sequence, and a third clone, p98 (T14718), coded for an FCRI (R91439) having a different C-terminal sequence. A fusion protein of FCRI and a receptor ligand will
                                                                                                                                                                                                                      09-APR-1996
                                                                                                                                                                                                                                                                                                                                                                                                                                     Cell surface antigen; cloning; immunoselection; immunotherapy; therapy; diagnosis; vector; FcRI; Fc receptor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The amino acid sequence (W00859) of human FCRI was detd. from a cDNA clone, p90 (T14719), obtd. from a cDNA library using an immunoselection cloning method. FCRI is a high affinity receptor for the Fc portion of IgG, normally located on cell surfaces of macrophages. Other CDNA clones (see also T14717-18) coded for variants (R91438-39) of the FCRI sequence. A fusion protein of FCRI and a receptor ligand will be helpful in increasing the potency of antibodies in therapy.

Isolated nucleic acid molecule encoding the CD19 cell surface antigen, useful for immunodiagnosis and immunotherapy of immune-mediated infections or disorders, e.g. asthma, immune-complex disease, parasiti immune-complex disease, parasitic

Example 10; 75pp; English.

proteins they encode, are useful immunotherapeutic applications, i treatment of immune-mediated infe based upon transient expression of a CSA in eukaryotic cells and physical selection of cells expressing the antigen by adhesion to (panning on) an antibody-coated substrate such as a culture dish. The present sequence is that of a human macrophage specific FCRI, as deduced from cDNA clone p135 (see A50592), which was isolated from a cDNA library expressed in COS cells using a novel method of the invention designed to isolate CSA nucleic acids. The method is animals; including humans. CSA nucleic acids isolated by the method of the invention, and amyloidosis, These disorders infections, l for immunodiagnostic and including the diagnosis a fections, diseases, and di include asthma diseases or multiple disorders in is

FcgammaRI is also known as CD64. Fc receptors play an important role in defending the body against infections. First, pathogens are opsonised by serum immunoglobulins. The resulting complex then binds to
                                                     cells expressing Fc receptors. FcgammaRI molecules are expressed by monocytes and macrophages, but expression can also be induced on neutrophils and eosinophils. Upon Fc receptor activation, immune effector pathways are activated, leading to immune response. The present sequence may be modified to produce recombinant versions. The recombinant Fc receptor consist only of the extracellular portion of the receptor and are not glycosylated i.e. they do not have transmembrane domains or signal peptides. The recombinant proteins may be used in immunoassays to determine the immune status of patients with chronic diseases of the immune system, e.g. AIDS, systemic lupus erythematosus (SLE), multiple
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          sclerosis. FCRI is a high affinity receptor for the Fc portion of IgG, normally located on the cell surfaces of macrophages. The ability to interfere with such bonding, or to cause it to occur on surfaces other than macrophages, is useful in therapy. A fusion protein of FCRI and a receptor ligand will be helpful to increase the potencies of antibodies in therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WPI; 2000-367968/32

            antithyroid; antiallergic; antibacterial; antiviral; dermatological; neuroprotective; cardiant; thrombolytic; coagulant; nootropic; vasotropic; antipsoriatic and antiangiogenic. The polynucleotides and polypeptides can be used for preventing, treating or ameliorating medical conditions and diagnosing pathological conditions. Polynucleotides, polypeptides, antibodies, agonists and antagonists from the present invention may be used to treat immune disorders by activating or inhibiting the proliferation, differentiation or mobilisation of immune cells, to treat disorders of haematopoietic cells, autoimmune disorders, allergic reactions, graft versus host disease and organ rejection.
                                                                                                                                                                          B43398 to B44239. The proteins can have activities based on the tissues and cells the genes are expressed in Example of activities include: cytostatic; proliferative; vulnerary; immunomodulator; antidiabetic; antiasthmatic; antirheumatic; antiarthritic; antiinflammatory; antithyroid; antiallergic: antiharterial antimicallergic: antiharterial

antigens from mammalian lymphocytes (see W80440-55). The isolated genes can be expressed in a prokaryotic or eukaryotic host cells produce the encoded protein. The invention also provides high efficiency expression vectors (see V63441 and V63444) which allow the generation of very large mammalian expression libraries. The purified genes and proteins are useful for immunodiagnostic and
                                                                                                                                                                                                             adhesion to an antibody-coated substrate. The method is useful for the isolation and cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes (see V63442-63) encoding cell surface antigens from mammalian lymphocytes (see W80440-55). The isolated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New cloning vector and polylinker - based on existing sequences for efficient cloning and expression of mammalian cDNA(s), especially human lymphocyte antigenic sequences

                                                       adhesion to an antibody-coated substrate. The method is useful for the isolation and cloning of any protein which can be expressed and transported to the cell surface membrane of a eukaryotic cell. It has been used to clone genes (see V63442-63) encoding cell surface antigens from mammalian lymphocytes (see W80440-55). The isolated genes can be expressed in a prokaryotic or eukaryotic host cells to produce the encoded protein. The invention also provides high efficiency expression vectors (see V63441 and V6344) which allow the generation of very large mammalian expression libraries. The purified genes and proteins are useful for immunodiagnostic and
                                                                                                                                                                                                                                                expression libraries is based on transient expression of an antigen in eukaryotic cells and selection of cells expressing the antigen by adhesion to an antibody-coated substrate. The method is useful for

I (FCRI), as deduced from CDNA clone p90 (see X07372) isolated using a rapid immunoselection cloning method from a CDNA library expressed in COS cells. The cDNA library was constructed from polyA RNA of cells from a single patient undergoing extracorporeal interleukin-2 induction therapy. Clones p135 (see V63456) and p98 (see X07373) were also obtained. A novel method for cloning cDNAs from mammalian

New cloning vector and polylinker – based on existing sequences for efficient cloning and expression of mammalian cDNA(s), especially human lymphocyte antigenic sequences

Example 10; Column 53-54; 75pp; English.

cc deduced from cDNA clone p98/X2 (see X07373) isolated using a rapid cc immunoselection cloning method from a cDNA library expressed in COS cells. The cDNA library was constructed from polya RNA of cells crom a single patient undergoing extracorporeal interleukin-2 from a single patient undergoing extracorporeal interleukin-2 clones also obtained. A novel method for cloning cDNAs from mammalian cc expression libraries is based on transient expression of an antipen by cathesion to an antibody-coated substrate. The method is useful for cd adhesion to an antibody-coated substrate. The method is useful for cd the isolation and cloning of any protein which can be expressed and cc transported to the cell surface membrane of a eukaryotic cell. It can be expressed to clone genes (see V63442-63) encoding cell surface can tigens from mammalian lymphocytes (see W80440-55). The isolated cc genes can be expressed in a prokaryotic or eukaryotic host cells to croduce the encoded protein. The invention also provides high cc efficiency expression vectors (see V63441 and V6344) which allow cc the generation of very large mammalian expression libraries. The cc purified genes and proteins are useful for immunodiagnostic and communotherapeutic applications, including the diagnosis and creatment of immune-mediated infections, diseases, and disorders of animals. Including high mamans animals, including humans.
